Conclusions and future
work

- Combining machine learning (Gaussian Process (GP)) and dynamical state-space modeling (Particle Filtering (PF)) for persons tracking
 - GP regression model trained on measurement data
 - Joint Particle Filter (JPF) with Markov Random Fields (MRF) is used to model multiple moving targets and their interaction
 - Gaussian Process Joint Particle Filtering (GPJPF): MRF and GP can be directly embedded on the JPF formulation

- Applying algorithm to persons tracking on a floor sensor
 - Floor matrix of pressure-sensitive binary switches is used

Conclusions and future
work

- Why persons localization and tracking?
 - Ubiquitous computing: every-where context-aware computing systems need person localization and identification to provide personalized services
 - Location-aware monitoring: health care, elderly care, and surveillance
 - Floor sensors: can be embedded to the environment, transparent and natural localization
- Why machine learning?
 - Non-linear human motion, noisy and limited measurement data
- Why Sequential Monte Carlo?
 - Variable number of multiple targets, non-linear motion, target interaction

■ Gaussian Process Regression

- Mapping from high dimensional input feature vector to continuous target $f(\mathbf{x}) \sim \mathcal{GP}(m(\mathbf{x}), k(\mathbf{x}, \mathbf{x}'))$
- GP mean $m(\mathbf{x}) = \mathbb{E}[f(\mathbf{x})]$
- GP covariance $k(\mathbf{x}, \mathbf{x}') = \mathbb{E}[f(\mathbf{x}) - m(\mathbf{x})][f(\mathbf{x}') - m(\mathbf{x}')] - m(\mathbf{x}')$

■ Learning displacement expert

- Learning regressor to predict spatial displacement [1]
 $\mathbf{u}_t = \mathbf{u}_{t-1} + GP_{\mu}(\mathbf{x})$
- Sampling from seed input examples
 $y \sim \text{uniform}(-\Delta, \Delta)$

■ Joint Particle Filter

- Implements sequential Bayesian filtering for multiple targets
- Each particle captures the state \mathbf{u} of all the targets jointly
- Sampling from the dynamic model $p(\mathbf{u}_t | \mathbf{u}_{t-1}) \propto \prod_i p(\mathbf{u}_t^i | \mathbf{u}_{t-1}^i)$
- A factored likelihood model $p(\mathbf{z}_t | \mathbf{u}_t) \propto \prod_i p(\mathbf{z}_t^i | \mathbf{u}_t^i)$
- Resampling $N_{eff} = \frac{1}{\sum_{k=1}^N (w_k)^2}$ (SIR Particle Filter)

■ Markov Random Fields model for interaction $G = (V, E)$

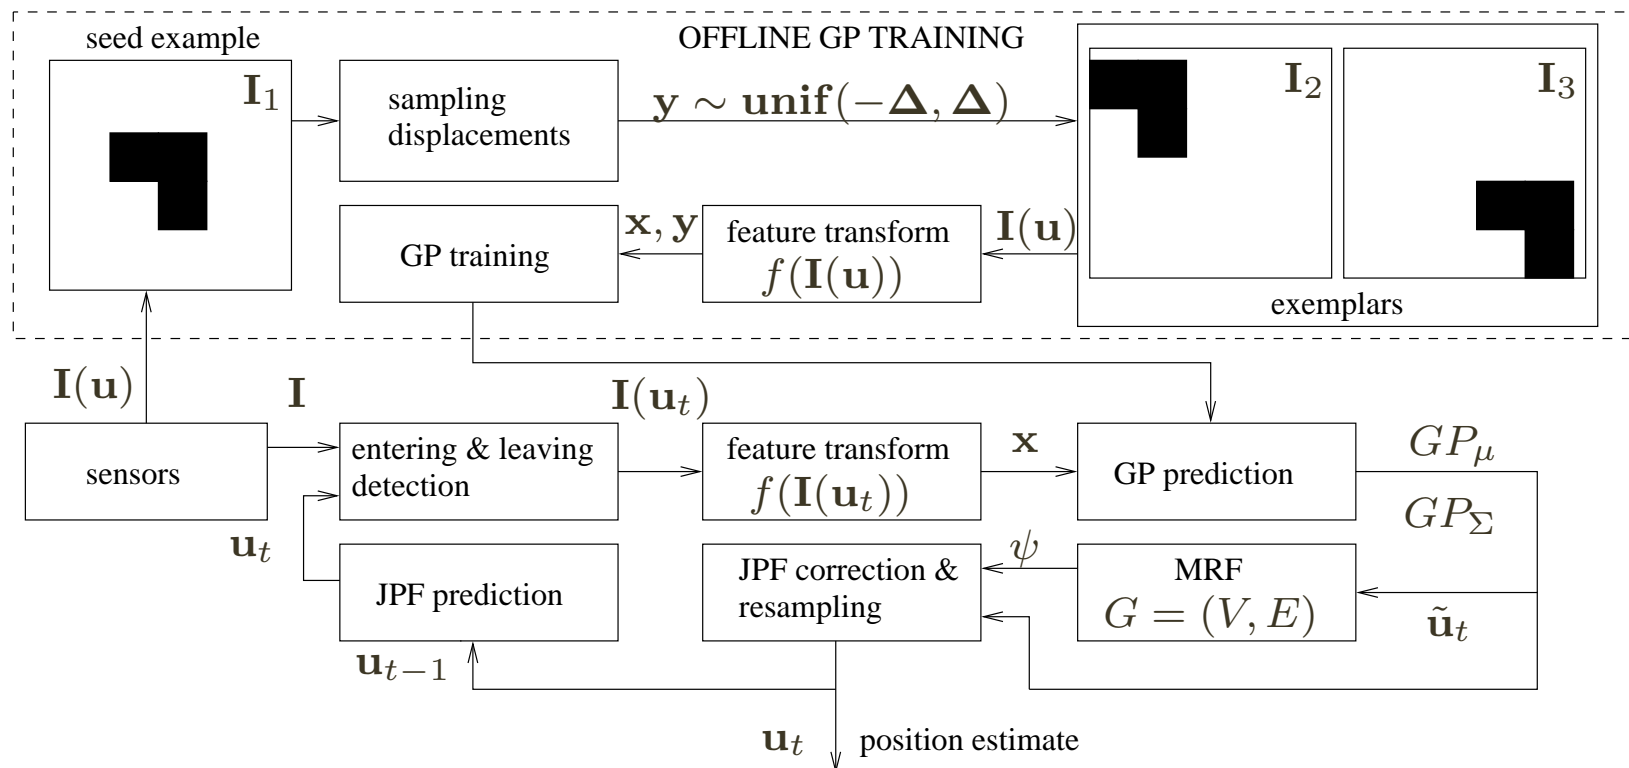

$$p(\mathbf{u}_t | \mathbf{u}_{t-1}) \propto \prod_{i=1}^n p(\mathbf{z}_t^i | \mathbf{u}_t^i) \prod_{i,j \in E} \psi(\mathbf{u}_t^i, \mathbf{u}_t^j)$$

- Pairwise interaction potentials $\psi(\mathbf{u}^i, \mathbf{u}^j) \propto \exp(-g(\mathbf{u}^i, \mathbf{u}^j))$
- MRF is formed between targets close to each others

- Combining JPF with Gaussian process correction step
- GPJPF importance weight update with embedded GP and MRF

$$w_t = w_{t-1} \prod_{i=1}^n \mathcal{N}(\tilde{\mathbf{u}}_t^i; \mathbf{u}_t^i, GP_{\Sigma}^i(\mathbf{x})) \prod_{i,j \in E} \psi(\tilde{\mathbf{u}}_t^i, \tilde{\mathbf{u}}_t^j)$$

1. Initialization ( $N$  particles,  $M$  targets),  $t = 0$ :
for  $i = 1$  to  $N$  do
  for  $j = 1$  to  $M$  do
    Initialize particles  $\mathbf{u}_0^{i,j} \sim p(\mathbf{u}_0^{i,j})$ 
    Initialize importance weights  $w_i = 1/N$ 
  end for
end for
2. Sequential Bayesian Filtering
for  $t = 1$  to  $\dots$  do
  2.1 Prediction Step
  for  $i = 1$  to  $N$  do
    for  $j = 1$  to  $M$  do
      Sample particles  $\tilde{\mathbf{u}}_t^{i,j} \sim p(\mathbf{u}_t^{i,j} | \mathbf{u}_{t-1}^{i,j})$ 
    end for
  end for
  2.2 Target Entering/Leaving Detection ( $M$  targets,  $P$  candidates),
  2.3 GP-MRF -based Correction Step
  2.4 Output estimation
  for  $j = 1$  to  $M$  do
    Estimate current state of each targets
     $E_j(g(\mathbf{u}_t^j)) = \sum_{k=1}^N w_k^i u_k^{i,j}$ 
  end for
  2.5 Resampling Step
  if  $N_{eff} < threshold$  then
    Resample particles  $\mathbf{u}_t^i$  from  $\tilde{\mathbf{u}}_t^i$  according to the importance
    weights  $\mathbf{w}_t^i$ 
    for  $i = 1$  to  $N$  do
      Re-initialize weights  $w_i = 1/N$ 
    end for
  else
     $\mathbf{u}_t \leftarrow \tilde{\mathbf{u}}_t$ 
  end if
end for

```

- GPJPF algorithm for a variable number of targets
- Entering sensor area (i.e., birth)

$$p(\mathbf{c}_t^i | \mathbf{x}_t) \approx \sum_{j=1}^n p(\mathbf{c}_t^i | \mathbf{x}_t^j)$$
- Leaving sensor area (i.e., death)

$$p(\mathbf{x}_t | \mathbf{I}_t) \approx \sum_{i=1}^n p(\mathbf{x}_t^i | \mathbf{I}_t^i)$$

```

GP-MRF -based Correction Step ( $M$  targets,  $N$  particles)
for  $i = 1$  to  $N$  do
  for  $j = 1$  to  $M$  do
    Calculate GP displacement  $GP_{\mu}(\mathbf{u}_t^{i,j})$ ,
     $GP_{\Sigma}(\mathbf{u}_t^{i,j})$ 
    Correct estimate  $\tilde{\mathbf{u}}_t^{i,j}$  using GP displacements
    Calculate likelihood score using GP
    Calculate interaction score using MRF
  end for
end for
for  $i = 1$  to  $N$  do
  Evaluate importance weight  $w_t^i$ 
end for
for  $i = 1$  to  $N$  do
  Normalize weights  $w_i = w_i / \sum_{k=1}^N w_k$ 
end for

Conclusions and future work

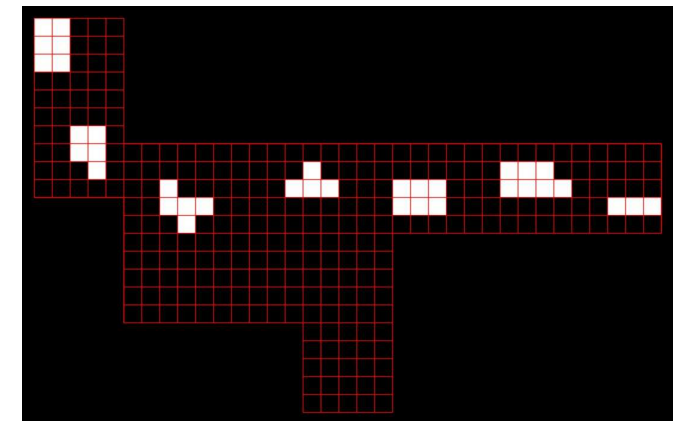

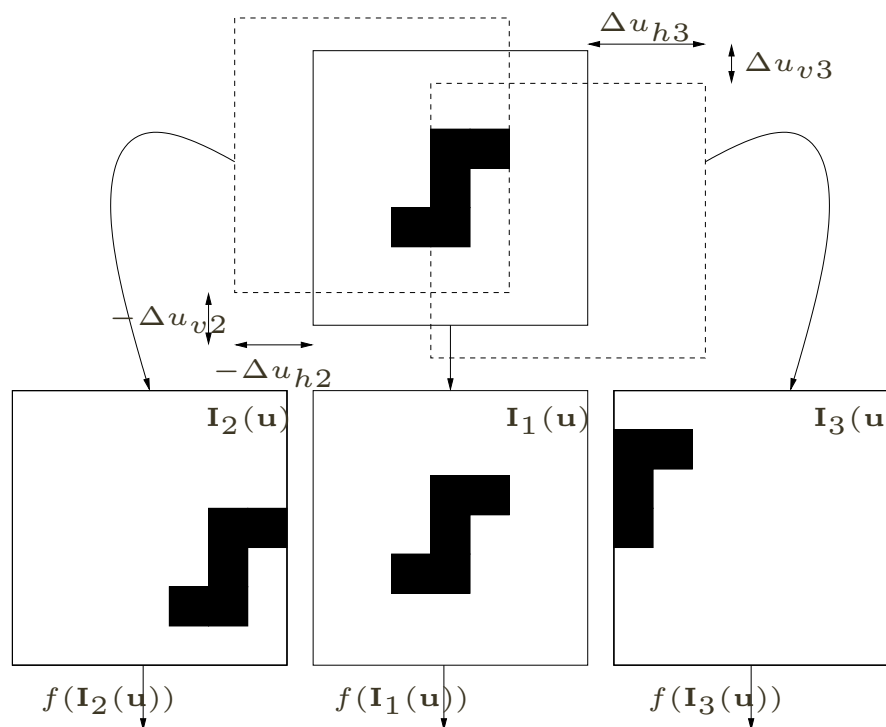

- “InfoFloor”
- Installed in Tokyo University of Agriculture and Technology
- 10cm x 10cm binary sensor tiles
- Each unit contains 25 tiles (size of 50cm x 50cm)
- Totally 300 binary switches
- Output sampling frequency 16Hz

■ Dataset

- 3 persons: 2 male and a female subjects wearing their own shoes
- 70 walking sequence of different scenarios

■ Training displacement expert

- A single GP model trained with 50 displacement examples
- Squared exponential kernel $k(\mathbf{x}, \mathbf{x}') = \sigma_f^2 \exp(-\frac{1}{2l^2} \|\mathbf{x} - \mathbf{x}'\|^2)$

■ Motion model

□ Stationary 1st-order Markov model

$$\mathbf{u}_t = \mathbf{F}\mathbf{u}_{t-1} + \epsilon$$

where

$$\mathbf{u}_t = [x_t \ y_t]^T, \mathbf{F} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$
$$\epsilon = [\epsilon_x, \epsilon_y]^T, \epsilon_i \sim \mathcal{N}(0, \sigma_i^2)$$

■ Measurement model

$$p(\mathbf{z}_t | \mathbf{u}_t) = \frac{1}{(2\pi)^{d/2} \sqrt{|GP_\Sigma|}} \exp\left[-\frac{1}{2} (GP_\mu^T GP_\Sigma^{-1} GP_\mu)\right]$$

- Tracking of 2 simultaneously walking persons
- Comparison of different PF-based algorithms
- Independent Particle Filter (IPF) [1], Gaussian Process Independent Particle Filter (GPIPF), Mixture Particle Filter (MPF) [2], Gaussian Process Mixture Particle Filter (GPMPF), Joint Particle Filter (JPF) [3], Gaussian Process Joint Particle Filter (GPJPF)

Method	Samples	Sequence failures (%)		Frame failures (%)		
		Total	Position	Identity	Number	Total
IPF [1]	50/target	57.14	15.18	6.00	7.18	16.58
GPIPF	25/target	52.86	13.65	5.10	6.92	15.28
MPF [2]	50/target	12.38	0.37	0.37	0.87	1.11
GPMPF	25/target	8.57	0.21	0.25	0.28	0.48
JPF [3]	100	9.05	0.04	0.00	0.47	0.51
GPJPF	50	3.81	0.09	0.00	0.06	0.12

- GP variants outperforms their counter parts and GPJPF performs best

work

■ Conclusions

- We have proposed an algorithm for multiple person tracking
- A novel algorithm which combines GPR and JPF
- Applied to sensor floor based position tracking
- Interesting approach to ubiquitous and context-aware computing

Thank You!
